AB	The low-alloy steel for high-strength rods contains C 0.15-0.50, Si 0.1-2.0, Mn 0.05-2.0, P ≤ 0.015 , S ≤ 0.02 , and Al 0.005-0.1%, and is heat treated for tempered martensite microstructure with tensile strength ≥ 145 kg/mm ² , prior austenite grain <u>aspect ratio ≥ 2</u> , and grain boundary <u>carbide size ≤ 0.2 μm</u> . The steel rods are manufd. by hot rolling at 700-850.degree. and draft $\geq 30\%$, quenched to the martensitic microstructure, reheated at ≥ 50 .degree./s, held at 350-500.degree. for 10-50 s, and tempered.
